

# 8.1.11 Sum Variable Number of Numbers

✓ Published

 Edit

At this link:

Create a function that will return the sum of any number of arguments,

For example:

```
a = sum((1, 3)) #sets a to 4
```

```
b = sum((1, 7, 2, 9)) #set b to 19
```

You will ask the user for a set of numbers separated by a comma to be summed. You will split the numbers up and put them in a tuple. Once you have the tuple created you will then:

```
print(sum(a)) #where a is the tuple you created from the string of numbers.
```
